

Integrate to User Profile, Pages or Groups apps

Integrate into User's Profile, Pages or Groups App

Support user's profile submenu

Implement hooks "*mobile.service_userapi_getprofilemenu_end.php*" using the following example code to add a menu to the user's profile page

mobile.service_userapi_getprofilemenu_end.php

```
<?php
/**
 * Add post navigation to user profile menu
 */

if (isset($query) && isset($local) && isset($result) && Phpfox::isModule('post') && isset($user)) {
    $result['post'] = [
        'label' => $local->translate("posts"),
        'path' => "post/list-item",
        'params' => [
            'headerTitle' => $local->translate('full_name_s_item', ['full_name' => $user['full_name'], 'item'
=> $local->translate("posts")]),
            'query' => $query,
        ],
    ];
}
```

Verify **User Detail Api** to make sure that your code works with API Call: `/user/{user_id}?access_token={{token}}`

Support pages detail app submenu

If your app is integrated to Pages app, in this case, we need to add a menu to view all items belonging to the page and a button to create a new post in page

Let's add new Hook "*/mobile.service_pageapi_getprofilemenu_end.php*" in your phpFox app using the following code

mobile.service_pageapi_getprofilemenu_end.php

```
<?php

if (isset($query) && isset($local) && isset($result) && Phpfox::isModule('post') && isset($page)) {
    $result['post'] = [
        'label' => $local->translate("posts"),
        'path' => "post/list-item",
        'params' => [
            'headerTitle' => $local->translate('full_name_s_item', ['full_name' => $page['title'], 'item' =>
$local->translate("posts")]),
            'query' => $query,
            // Add create button
            'headerRightButtons' => [
                [
                    'icon' => 'plus',
                    'action' => Screen::ACTION_ADD,
                    'params' => [
                        'resource_name'=> 'post',
                        'module_name'=> 'post',
                        'query' => [
                            'item_id' => $page['page_id'],
                            'module_id' => 'pages'
                        ]
                    ]
                ]
            ]
        ],
    ];
}
```

Now, verify Get Detail Pages API to make sure it responds details of the integrated app

API Call: /pages/1?access_token={{token}}

Support groups detail app submenu

If your app is integrated with Groups app, you need to add a menu to view all items belonging to the group and a button to create a new post in the group

Add new Hook "/mobile.service_groupapi_getprofilemenu_end.php" in your app using the following code

mobile.service_pageapi_getprofilemenu_end.php

```
<?php

if (isset($query) && isset($local) && isset($result) && Phpfox::isModule('post') && isset($page)) {
    $result['post'] = [
        'label' => $local->translate("posts"),
        'path' => "post/list-item",
        'params' => [
            'headerTitle' => $local->translate('full_name_s_item', ['full_name' => $page['title'], 'item' =>
$local->translate("posts")]),
            'query' => $query,
            // Add create button
            'headerRightButtons' => [
                [
                    'icon' => 'plus',
                    'action' => Screen::ACTION_ADD,
                    'params' => [
                        'resource_name'=> 'post',
                        'module_name'=> 'post',
                        'query' => [
                            'item_id' => $page['page_id'],
                            'module_id' => 'pages'
                        ]
                    ]
                ]
            ]
        ],
    ];
}
```

Now, you can verify Get Detail Groups API to make sure it has response your integration

API Call: **/groups/{group_id}?access_token={{token}}**

The response would be same as one of Pages integration
