

Adding Feeds to the Global Search

Requires: phpFox 4.4 or higher

Introduction

You can add search functionality to your apps by mapping the search values in your `app.json` file. Searching feeds created by apps requires that you add feeds using the method detailed [here](#).

Mapping Feeds

In your `app.json` file you can add the following associative object to map your feeds to the global search.

```
"map_search": {  
  "title": "caption",  
  "link": "\v\play\/:id",  
  "info": "Video"  
}
```

The keys identify what we should replace, which is based on what you add in your feeds **content** when **POST**ing it.
