Adding a New Language Package

This tutorial will help you build a new language for a phpFox site.

Step 1: Clone a new package from an existing package.

English is default language of **phpFox**. If you want to build a new, we suggest that you should clone from it.

- Go to **ACP > Globalization > Languages > Actions >> New Language**, fill in all info to add a new language.

- **Create From**: Choose language you want to clone from, **English (US)** is recommended.
- **Name**: Name of the new language.
- **Language Abbreviation Code**: abbreviation code of the new language.
- **Text Direction**: text direction of the new language.

You need waiting some minutes for importing phrases. After import process is done, your new language package will be listed in the **Languages Manage Page**

Manage Language Packages

Actions ▼

| (MASTER) English (US) | 4.0.1 | Latest Version: N/A | ⚙ |
| Spanish | 4.0.1 | Latest Version: N/A | ⚙ |

Step 2: Translate phrases for the new language.

There are 2 ways for you to translate the language phrases

Translate via Manage Phrases feature in Admincp

In the **Languages Manage Page**, click on the setting icon of the new language, choose **Manage Phrases**.

| (MASTER) English (US) | 4.0.1 | Latest Version: N/A | ⚙ |
| Spanish | 4.0.1 | Latest Version: N/A | ⚙ |

Featured Language Packs

- Manage Phrases
- Edit Settings
- Find Missing Phrases
- Export
- Set As Default
- Delete

This page will list all phrases you need to translate to your language.

		Category successfully updated	Categoría actualizada con éxito
☐	category_succesfully_		
☐	sponsor_error_not_for	That blog is no longer available.	Ese blog ya no está disponible.
☐	sponsor_title_blog	Blog: {sBlogTitle}	Blog: {sBlogTitle}
☐	sponsor_paypal_mess	Sponsor of blog {sBlogTitle}	Patrocinador del blog {sBlogTitle}

Note: *Do not translate words in brackets {} because they are variables and will be replaced.*

Click **Save All** after you translate all phrases.

Translate by editing exported file

First, export your language package.

(MASTER) English (US)	4.0.1	Latest Version: N/A	⚙
Spanish	4.0.1	Latest Version: N/A	⚙

Next, extract downloaded package and open file **/upload/include/xml/language/***your-language-abbreviation-code***/module-core.xml**. In this file, you can translate all phrases.

```
<phrase var_name="global_settings" added="1487058154">Global Settings</phrase>
<phrase var_name="module_settings" added="1487058154">Module Settings</phrase>
<phrase var_name="product_settings" added="1487058154">Product Settings</phrase>
<phrase var_name="variable" added="1487058154">Variable</phrase>
<phrase var_name="type" added="1487058154">Type</phrase>
<phrase var_name="string" added="1487058154">String</phrase>
<phrase var_name="boolean" added="1487058154">Boolean</phrase>
<phrase var_name="integer" added="1487058154">Integer</phrase>
<phrase var_name="array" added="1487058154">Array</phrase>
<phrase var_name="defined_drop_down" added="1487058154">Defined Drop-Down</phrase>
<phrase var_name="value" added="1487058154">Value</phrase>
<phrase var_name="language_package_details" added="1487058154">Language Package Details</phrase>
<phrase var_name="title" added="1487058154">Title</phrase>
<phrase var_name="info" added="1487058154">Info</phrase>
<phrase var_name="submit" added="1487058154">Submit</phrase>
<phrase var_name="true" added="1487058154">True</phrase>
<phrase var_name="false" added="1487058154">False</phrase>
```

After translating completely, upload folder **your-language-abbreviation-code** in **/upload/include/xml/language/** to your server directory **/PF.Base /include/xml/language**.

Next, delete old language package.

(MASTER) English (US)		4.0.1	Latest Version: N/A		⚙
Spanish		4.0.1	Latest Version: N/A		⚙
