

Identifying Route Names

When you are developing an app you may need to know the route name in order to assign blocks to it. We have something called **Techie Mode** and when this is enabled it will display a little box at the bottom of the site of each page with the current routes name.

The screenshot shows the PHPFOX website interface. At the top, there is a search bar and navigation icons. Below that is a main navigation menu with items like Home, Blogs, Members, Photos, Forum, Polls, Quizzes, Events, Music, Marketplace, Pages, and Videos. The 'Events' menu item is highlighted. On the left side, there is a sidebar with categories like 'All Events', 'My Events', 'Events I'm Attending', etc. The main content area is titled 'Events' and contains a search bar, sorting options (Sort: Latest, Show: 12 per page, When: Upcoming), and a message 'No events found.'. At the bottom of the page, a purple box with a red border displays the following route information: `ROUTE: event.index ID: #event_index CSS: n/a`.

Enabling Techie Mode

To enable techie mode, you need to create a file called **debug.sett.php** and place it in the folder **PF.Base/file/settings/** (if it does not exist already). We then need to add the techie constant in the file

```
<?php  
  
define('PHPFOX_IS_TECHIE', true);
```
