moment

Description

Core\Moment **moment**([int $seconds])

Provides methods that are part of our cores Moment class that deals with time related functions.

Parameters

$seconds

> Shorthand call to toString() method, which converts UNIX time to human readable time stamps.

Examples

```php
<?php

route('/foo', function() {

    // Prints the current UNIX time stamp
    $time = moment()->now();

    echo $time;

    // Converts a UNIX time stamp to human readable time (e.g 1 second ago)
    echo moment()->toString($time);

    /**
     * Short hand of the toString() method
     */
    echo moment($time);

});
```

Methods

Method	Description	Usage	Returns

now()	Get the current UNIX time stamp.	```echo moment()->now();
		
		// You can shorthand it as well
		echo moment();```
			Returns current UNIX time stamp.

toString(int $seconds)
 	
---- 	
 	
$seconds
 	
UNIX time stamp
	Converts a UNIX time stamp to human readable
	time (e.g 1 second ago)
		``$time = moment()->now();
		
		echo moment()->toString($time);
		
		/**
		 * Short hand of the toString()
		method
		 */
		echo moment($time);```
			Examples based on time stamp...
			
			- 1 seconds ago
			- about 4 hours ago
			- 3 days ago
			- January 15, 2015
