

# Identifying Route Names

When you are developing an app you may need to know the route name in order to assign blocks to it. We have something called **Techie Mode** and when this is enabled it will display a little box at the bottom of the site of each page with the current routes name.

The screenshot shows the PHPFOX website interface. At the top is a navigation bar with the PHPFOX logo, a search bar, and user icons. Below this is a secondary navigation bar with links to Home, Blogs, Members, Photos, Forum, Polls, Quizzes, Events (highlighted), Music, Marketplace, Pages, and Videos. The main content area is titled 'Events' and includes a 'CREATE NEW EVENT' button, a search bar, and filters for sorting (Latest), showing (12 per page), and when (Upcoming). It states 'No events found.' On the left sidebar, there are links for 'All Events', 'My Events', 'Events I'm Attending', 'Events I May Attend', 'Events I'm Not Attending', and 'Event Invites', followed by a 'Categories' section with 'Arts'. At the bottom of the page, a purple box displays the following information: **ROUTE:** event.index **ID:** #event\_index **CSS:** n/a.

## Enabling Techie Mode

To enable techie mode, you need to create a file called **debug.sett.php** and place it in the folder **PF.Base/file/settings/** (if it does not exist already). We then need to add the techie constant in the file

```
<?php  
  
define('PHPFOX_IS_TECHIE', true);
```
