Admin Controller

You can define menus in AdminCP in file **Install.php**

```
protected function setOthers()
{
    $this->admincp_menu = [
        'Manage To Do' => 'todo', // 'todo' is app's alias
    ];

    $this->admincp_route = 'admincp.todo'; // 'todo' is app's alias
}
```

After that, on **start.php**, we add below lines.

```
// 'todo' is app's alias
$module->addComponentNames('controller', [
    'todo.admincp.index' => Controller\AdminManageTodoController::class
]);

group('todo/admincp', function () {
    route('/', 'todo.admincp.index');
});
```

Finally, we add controller file and view file.

Path of controller file:

- Apps/TodoList/Controller/AdminManageTodoController.php

Path of view file:

- Apps/TodoList/views/controller/admincp/index.html.php

Sample structure of a controller file

```
<?php
namespace Apps\TodoList\Controller;

use Phpfox_Plugin;

defined('PHPFOX') or exit('NO DICE!');

class AdminManageTodoController extends \Phpfox_Component
{
    public function process()
    {
        //Put your code here
    }

    public function clean()
    {
        (($sPlugin = Phpfox_Plugin::get('todo.component_controller_admincp_manage_clean')) ? eval($sPlugin) :
false);
    }
}
```
