

Setting Up a Payment Gateway

Archives

You are using phpFox version earlier than 4.6.0? Please refer instruction for this article [here](#).

In order to receive payments on your site (for subscriptions, ads, sponsor blocks, e-gifts, etc) it is necessary to set up a payment gateway for your site. By default, phpFox offers PayPal as a payment gateway.

This assumes you are already logged in as the Admin user and are [logged into the Admin CP](#).

- Click **Globalization >> Payment Gateways**.

- Click on the drop-down option at the left of the gateway, and select "Edit Gateway Settings".
- A popup form will come up to fill in as you want. This example shows Paypal.

1. Name of the Gateway as you want to display it.
2. A description that your users will see.
3. Active: Set to Yes to activate this or No to deactivate it.
4. Test Mode: Set to Yes to test the gateway (by purchasing stuff on the front end to see how the payments are working). Set to No to have it as a live gateway.
5. PayPal Email: Where you want payments for things like subscriptions, ads, etc to go.
6. Client ID: This is public identifier for application
7. Secret: This is a secret known only to the application and the authorization server.

Editing: PayPal
