

# One-line Menu Component

In phpFox version 4.6.0, we have implemented a component to support build one-line menu. It means in case your menu items are so much and overflow the width of menu, they will be put in a dropdown list automatically. To use this component, you need to follow below guidelines in both of HTML and CSS code.

## HTML Structure:

```
<ul class="your-menu" data-component="menu">
  <div class="overlay"></div>
  <li>Menu 1</li>
  <li>Menu 2</li>
  <li>Menu 3</li>
  <li>Menu 4</li>
  ...
  <li>Menu n</li>
  <li class="hide explorer">
    <a data-toggle="dropdown" role="button">
      {_p var='your_dropdown_phrase'}
    </a>
    <ul class="dropdown-menu">
    </ul>
  </li>
</ul>
```

## CSS:

- Your menu items must be wrapped when overflow.
- Set `overflow: hidden` to `.your-menu` is necessary to hide wrapped menu items.
- `div.overlay` is not required but it is necessary to cover the right menu items when menu is building.

After menu component is built:

- Menu component (`.your-menu`) will set `overflow: visible`.
- Menu component will add class `.built`.
- `.explorer` will remove class `.hide` if there is at least one menu item put in dropdown (`.dropdown-menu` inside `.explorer`).
- `div` inside `ul` will be hidden.

Sample HTML after building:

```
<ul class="your-menu built" data-component="menu" style="overflow: visible;">
  <div class="overlay" style="display: none;"></div>
  <li>Menu 1</li>
  <li>Menu 2</li>
  <li>Menu 3</li>
  <li class="explorer">
    <a data-toggle="dropdown" role="button">
      {_p var='your_dropdown_phrase'}
    </a>
    <ul class="dropdown-menu">
      <li>Menu 4</li>
      <li>Menu 5</li>
      ...
      <li>Menu n</li>
    </ul>
  </li>
</ul>
```

Congratulation! Your menu has been built successfully.
