

How to set up Mobile API on phpFox site

This article will guide you to setup Server API for phpFox sites in order to work with the Mobile apps. This guide can be applied for both "default" phpFox Mobile app and Premium Mobile Version.

Since your mobile app is built successfully, the next step is to make it up and running by setting up Mobile API on your phpFox site.

Basically, you need to install 2 apps to your site:

- **RESTful API app**
- **Mobile API app**

Note

- RESTful API **MUST** be installed before Mobile API. If you are installing in the wrong order, please uninstall both and install these apps again in the correct order.
- Clients in RestFul API is auto-generated. Do not edit this field.
- **SSL** MUST be set up for the phpFox site.
- The web server (Apache or Nginx) has to allow **HTTP** Authorization header.

Start from **AdminCP >> Apps >> Find More >>** Search for *RESTful API* (Version 4.2.0+) and *Mobile API* app on phpFox Store and install them.

Name	Version	Latest	Author	Active	Settings
 RESTful API	4.2.0	4.2.0	phpFox	<input checked="" type="checkbox"/>	

Name	Version	Latest	Author	Active	Settings
 Mobile Api	4.0.1	4.0.1	phpFox	<input checked="" type="checkbox"/>	

Enable Push Notification feature on your phpFox site

You will need to configure **Firestore Server Key** setting under *AdminCP > Apps > Installed > Mobile API > Settings* to enable Push Notification feature.

For **Premium Mobile apps version**, you can *create a new Google account* and give us the credentials of this new account, we will generate Firebase info for you on this account while building your mobile apps.

If you are using **default phpFox Mobile apps** with your phpFox site, please configure **Firestore Server Key** setting with following value:

```
AAAA0o_TDcM:APA91bGIKlteewtUo4mtA_uo jkvMiIPzbLF4VnubjMUnp_rrGpjN2lCe0BbKryJqQPhmrBuhee_clQ3iLq-fgaKb6mOG0MgKR5ki1fcKidqrnGx5-W5hzFAxSSvrEvsJnvLSGMgOW680
