# Tutorial 5: Show Post on Detail Screen

When tapping on a Post item, it navigates to a Detail screen, and display data response from **Detail Resource API**

Detail Resource API pattern: **"url/restful_api/mobile/post/post_id?access_token=token"**

Code of the API is implemented in method **findOne()** of **PostApi** class. *ID* parameter will be resolved automatically. The Resolver instance is a Helper class that helps extract or validate parameters from the request.
PostApi.php

```
class PostApi extends AbstractResourceApi implements MobileAppSettingInterface
{
/.../
        public function findOne($params)
        {
                $id = $this->resolver->resolveId($params);
                // Todo: Loading data form database and build as resource
                $post = new PostResource([
                        'post_id' => $id,
                        'title' => "Post's title example " . $id,
                        'description' => "Post's description " . $id,
                        'text' => "Post's Full Text " .$id
                ]);
                return $this->success($post);
        }
}
```

The result of the Detail screens are as following images

Posts
