

Server Setup for IM with Google Firebase

How to enable the Firebase server on IM App:

Go to AdminCP > Apps > Installed > Instant Messaging > Settings and select "Firebase" at setting **Select chat server**

The screenshot shows the AdminCP interface with the following elements:

- Navigation tabs: **Settings** (active), Instant Messaging, Manage Notification Sound, Import Data From v3.
- Section header: **Select chat server**
- Dropdown menu: A box containing the text "Firebase" with a downward arrow icon on the right.

Then, configure the required **Firebase Config Object** setting. We will guide you to get the value when adding Firebase project which will be instructed below.

Also, you can configure **Algolia App ID** (Optional) and **Algolia API Key** (Optional) to support search messages. The instructions will be given later.

Setup Google Firebase App:

1. Add Firebase project

Go to [Firebase console](#)

Select **Add Project** if you don't have one

The screenshot shows the 'Add a project' dialog box in the Firebase console. The dialog has a title bar with a close button (X) in the top right corner. The main content area is divided into several sections. The first section is 'Project name', which contains a text input field with the value 'My awesome project' and a dropdown arrow. To the right of this field is a tip: 'Tip: Projects span apps across platforms' with a question mark icon. The second section is 'Project ID', which contains a text input field with the value 'my-awesome-project-id'. The third section is 'Locations', which contains a list of locations: 'United States (Analytics)' and 'nam5 (us-central) (Cloud Firestore)'. There is a pencil icon next to the second location. The fourth section is a checkbox labeled 'Use the default settings for sharing Google Analytics for Firebase data'. This checkbox is checked. Below this checkbox is a list of five items, each with a checkmark and a description: 'Share your Analytics data with all Firebase features', 'Share your Analytics data with Google to improve Google Products and Services', 'Share your Analytics data with Google to enable technical support', 'Share your Analytics data with Google to enable Benchmarking', and 'Share your Analytics data with Google Account Specialists'. The fifth section is a checkbox labeled 'I accept the controller-controller terms. This is required when sharing Analytics data to improve Google Products and Services. Learn more'. This checkbox is unchecked. At the bottom of the dialog are two buttons: 'Cancel' and 'Create project'.

Add a project

Project name

My awesome project

Tip: Projects span apps across platforms

Project ID

my-awesome-project-id

Locations

United States (Analytics)

nam5 (us-central) (Cloud Firestore)

☒ Use the default settings for sharing Google Analytics for Firebase data

- ✓ Share your Analytics data with all Firebase features
- ✓ Share your Analytics data with Google to improve Google Products and Services
- ✓ Share your Analytics data with Google to enable technical support
- ✓ Share your Analytics data with Google to enable Benchmarking
- ✓ Share your Analytics data with Google Account Specialists

☐ I accept the [controller-controller terms](#). This is required when sharing Analytics data to improve Google Products and Services. [Learn more](#)

Cancel Create project

Go to App **Dashboard**, select **Project Overview > Project settings**

In **Your apps** section click on icon `</>` to Add Firebase to web app

The screenshot shows the 'Add a project' dialog box in the Firebase console. The dialog has a title bar with a close button (X). It contains several sections for configuring a new project:

- Project name:** A text input field with the value 'My awesome project' and a dropdown arrow.
- Project ID:** A text input field with the value 'my-awesome-project-id'.
- Locations:** A section showing 'United States (Analytics)' and 'nam5 (us-central) (Cloud Firestore)' with a pencil icon for editing.
- Analytics sharing:** A section with a checked checkbox 'Use the default settings for sharing Google Analytics for Firebase data' and a list of five sharing options, each with a checkmark:
 - ✓ Share your Analytics data with all Firebase features
 - ✓ Share your Analytics data with Google to improve Google Products and Services
 - ✓ Share your Analytics data with Google to enable technical support
 - ✓ Share your Analytics data with Google to enable Benchmarking
 - ✓ Share your Analytics data with Google Account Specialists
- Terms:** A section with an unchecked checkbox 'I accept the [controller-controller terms](#). This is required when sharing Analytics data to improve Google Products and Services. [Learn more](#)'.
- Buttons:** 'Cancel' and 'Create project' buttons at the bottom right.

Additional details visible in the dialog include a tip: 'Tip: Projects span apps across platforms' with a question mark icon, and a small icon showing 'android + iOS + </>'.

Add **App nickname**, then click **Register App**, then click **Continue to console** to back to **Project Settings** page

 **Add Firebase to your web app**

 Register app

 **Add Firebase SDK**

Copy and paste these scripts into the bottom of your `<body>` tag, but before you use any Firebase services:

```
<!-- The core Firebase JS SDK is always required and must be listed first -->
<script src="https://www.gstatic.com/firebasejs/6.1.0/firebase-app.js"></script>

<!-- TODO: Add SDKs for Firebase products that you want to use
      https://firebase.google.com/docs/web/setup#config-web-app -->

<script>
  // Your web app's Firebase configuration
  var firebaseConfig = {
    apiKey: "[REDACTED]",
    authDomain: "[REDACTED].firebaseapp.com",
    databaseURL: "https://[REDACTED].firebaseio.com",
    projectId: "[REDACTED]",
    storageBucket: "[REDACTED].appspot.com",
    messagingSenderId: "[REDACTED]",
    appId: "1:555767431731:web:b5147f0326945398"
  };
  // Initialize Firebase
  firebase.initializeApp(firebaseConfig);
</script>
```

Learn more about Firebase for web: [Get Started](#), [Web SDK API Reference](#), [Samples](#)

Continue to console

In **Your Apps** section, chose the app you just created, then click on **Config** option of **Firebase SDK snippet**. Copy all script code and paste to **Firebase Config Object** setting in AdminCP > Apps > Installed > Instant Messaging > Settings area.

Firebase SDK snippet

☐ CDN ?

☒ **Config** ?

Copy and paste these scripts into the bottom of your `<body>` tag, but before you use any Firebase services:

```
const firebaseConfig = {
  apiKey: "[REDACTED]",
  authDomain: "[REDACTED].firebaseapp.com",
  databaseURL: "https://[REDACTED].firebaseio.com",
  projectId: "[REDACTED]",
  storageBucket: "[REDACTED].appspot.com",
  messagingSenderId: "[REDACTED]",
  appId: "1:555767431731:web:b5147f0326945398"
};
```

Remove this app

2. Enable Firebase Database

Back to Firebase App **Dashboard**, select **Develop > Database**. Then, right-click on **Create Database**. Select mode and click **Enable**

After enabling, you will redirect to database page. In that page, select tab **Indexes** and add 2 **Composite** indexes to Database by click on **Create index manually**.

Then, configure fields as 2 screenshots below:

Create a composite index

Cloud Firestore uses composite indexes for compound queries not already supported by single field indexes (ex: combining equality and range operators).

Collection ID

messages

Fields to index

At least two fields required*

1	receiver	Ascending
2	seen	Ascending
3	time_stamp	Ascending

Add field

Query scopes

☒ Collection

For queries within a specific collection path

Cancel Create index

Creation time depends on the amount of data being indexed

base

Add index

Collection ID	Fields indexed	Query scope	Status
messages	deleted Ascending text Ascending time_stamp Descending	Collection	Enabled
messages	receiver Ascending seen Ascending time_stamp Ascending	Collection	Enabled

Go to Develop > Authentication, enable Sign-in method for **Email/Password provider** in your project to allow users access to the database, as the following screenshot:

Then, go to **Database > Rules** tab and add the following database rules:

```
service cloud.firestore {
  match /databases/{database}/documents {
    match /{document=**} {
      allow read, write:
        if request.auth.uid != null && request.auth.token.email.matches('^user_([0-9]+)@.*');
    }
  }
}
```

Rules table will be as the below image:

Now, you can start to use IM App with Firebase.

Setup Algolia to support search messages

Note: Without Algolia configure on IM App, users can only search for messages with prefix and case sensitive.

Go to [Algolia App Manage](#), sign up if you don't have an account

Note: Algolia is pay to use, so you should check their pricing at [Algolia Pricing](#)

Go to your **App Dashboard**

Select **Indices**, create new Index with name **im_chat**

Create index

To handle indices across multiple environments, just prefix/suffix your index name like dev_NAME, test_NAME, or prod_NAME

Index name

im_chat

Cancel Create

After Create Index, select menu **API keys** on left

- Copy **Application ID** and paste to setting **Algolia App ID** on IM App
- Copy **Admin API Key** and paste to setting **Admin API Key** on IM App

algolia

LTERNON5IJ
(UNNAMED APP)

Overview Indices Analytics Query suggestions Monitoring Infra API keys Team Billing

Your API Keys All API Keys

Application ID

LTERNON5IJ

This is your unique application identifier. It's used to identify you when using Algolia's API.

Search-Only API Key

This is the public API key to use in your frontend code. This key is only usable for search queries.

Regenerate

Admin API Key

This is the ADMIN API key. Please keep it secret and use it ONLY from your backend: this key is used to create, update and DELETE your indices. You can also use it to manage your API keys.

Now, users can search full-text messages with IM App and Firebase
